

The SOFT line offers silent stoves with forced ventilation that can be switched off, which distributes hot air by means of thermal radiation for a completely natural relaxation. Heat is transmitted into the room via sinusoidal convection, that is through curved heat exchange surfaces that retain the air flow for longer to confer additional heat even at lower power levels, thereby ensuring maximum savings and total comfort.

The wide, well-developed THERMO range includes all categories and both types of fuels: pellets and wood. The KLOVER heating system appliances - heating stoves, heating fireplaces and boilers - feature unparalleled performance levels for this kind of appliance accompanied by technical advantages such as Sicuro Top, the dual centrifugal fan system that does not remove heat from the heating system, the double ceramic glass that protects your children against possible burns and outstanding mechanical durability that sets them apart from marketplace competitors.
